- scripts with annotations
- compatible scripts with mobile devices
- for iOS and Android platform project has simple touchable buttons to steer motor
- project has convenient to modify the setting
- efficient system of rectifying the motorbike
- rebuild balans system
- motorbike physics

HOW TO ADD OWN 3D MODEL?

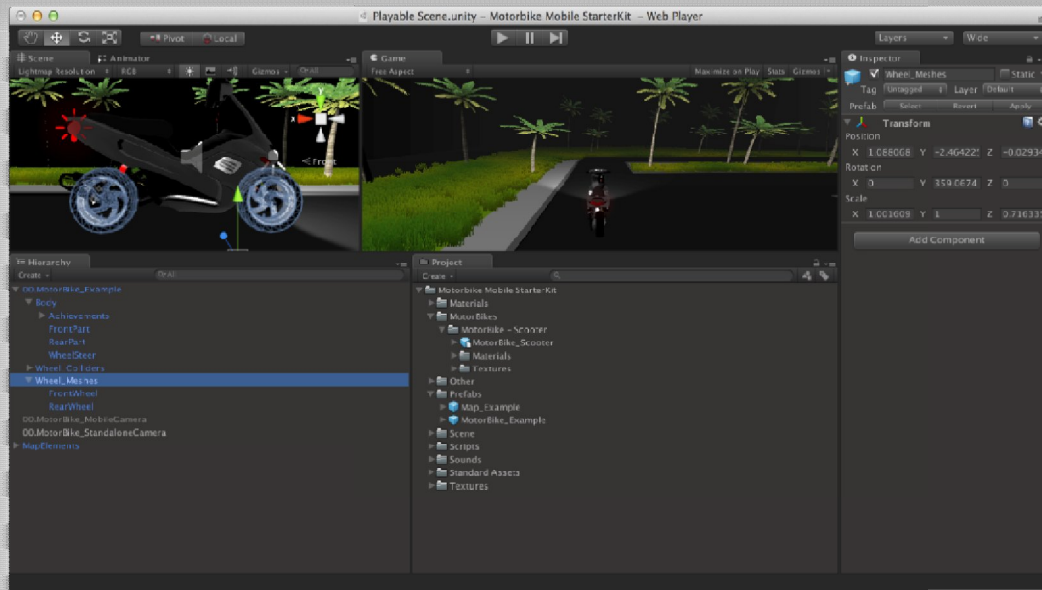

1. Run your 3d motorbike model in any 3d program

2. Make a divide and set similar names as lower.

3. Import your motorbike model to unity and just exchange parts in Hierarchy.

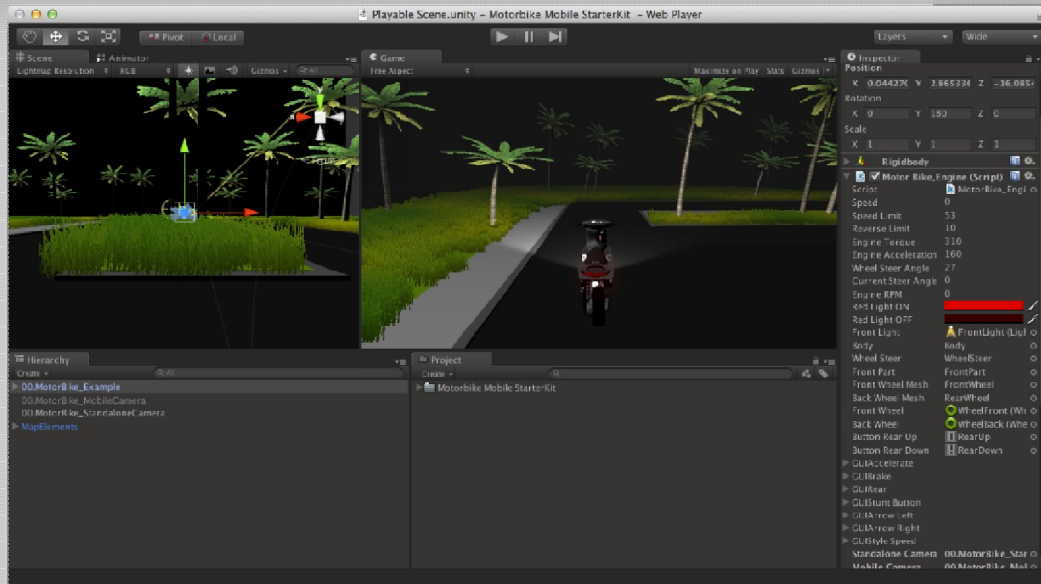

4. Place parts in identical position as the last.

5. Remember: put all new replaced meshes(gameobjects) to Motorbike script in Inspector.

6. Check it out and test. If you have problems with rotation steer wheel just place it in new empty gameobject and rotate to get this same effect.

HOW TO CHANGE MOTORBIKE SETTINGS AND SET OWN MODIFICATIONS

Just look out MotorBike_Engine script. Here you have a few outputed values. You can still control and check main of current values like as speed, steerangle and engine rpm.

Moreover you can set your own SpeedLimit, ReverseLimit, EngineTorque, Engine Acceleration and max. WheelSteer angle. Dependences of values are described in script. There you will be able to read and set rightly modification for your motorbike.
